

## 1. Create VPC with 2 private and 2 public subnets.

- ➔ Created a VPC with a suitable CIDR block.
- ➔ Created 2 public subnets.
- ➔ Created 2 private subnets.
- ➔ Verified the subnet CIDR ranges and VPC associations.

The screenshot displays the AWS Management Console interface. The top section shows the 'Create VPC' wizard with the following settings:

- VPC settings**
  - Resources to create:** ☒ VPC only
  - Name tag - optional:** my-vpc1
  - IPv4 CIDR block:** ☒ IPv4 CIDR manual input, 172.168.0.0/16
  - IPv6 CIDR block:** ☒ No IPv6 CIDR block
  - Tenancy:** Default

The bottom section shows the 'VPC dashboard' for the newly created VPC 'vpc-0072a383b0decf876 / my-vpc1'. A green banner at the top states 'You successfully created vpc-0072a383b0decf876 / my-vpc1'. The dashboard includes a 'Details' tab with the following information:

| Property                                   | Value                  |
|--------------------------------------------|------------------------|
| VPC ID                                     | vpc-0072a383b0decf876  |
| State                                      | Available              |
| Block Public Access                        | Off                    |
| DNS hostnames                              | Disabled               |
| DNS resolution                             | Enabled                |
| Tenancy                                    | default                |
| DHCP option set                            | dopt-0fcb7e541a882ba45 |
| Main network ACL                           | acl-0087a799bb3b24a99  |
| Default VPC                                | No                     |
| IPv4 CIDR                                  | 172.168.0.0/16         |
| IPv6 CIDR (Network border group)           | -                      |
| Network Address Usage metrics              | Disabled               |
| Route 53 Resolver DNS Firewall rule groups | -                      |

## 2. Enable DNS Hostname in VPC.

➔ Opened the VPC settings.

- ➔ Enabled DNS Resolution for the VPC.
- ➔ Enabled DNS Hostnames for the VPC.
- ➔ Verified that the DNS settings were enabled successfully.

### 3. Enable Auto Assign Public IP in 2 public subnets.

- ➔ Opened the subnet configuration.
- ➔ Selected the first public subnet.
- ➔ Enabled Auto-Assign Public IPv4 Address for it.
- ➔ Repeated the configuration for the second public subnet as well.
- ➔ Verified that both public subnets were configured to assign public IP addresses automatically.

**Subnets without explicit associations (2)** Edit subnet associations

The following subnets have not been explicitly associated with any route tables and are therefore associated with the main route table:

## 5. Add 2 public subnets in public route table.

- ➔ Created a public route table for the VPC.
- ➔ Associated both public subnets with the public route table.
- ➔ Verified both public subnets were associated successfully.

Route table `rtb-05daefc11ce9f6c33` / `my-rt-public` was created successfully.

### rtb-05daefc11ce9f6c33 / my-rt-public

| my-subnet1-pub | <code>subnet-0a4291f359d10db50</code> | 172.168.0.0/28  | -         |

**Subnets without explicit associations (0)**

The following subnets have not been explicitly associated with any route tables and are therefore associated with the main route table:

## 6. Public route table will have the routes to internet and local.

- ➔ Opened the public route table.
- ➔ Verified the default local route for VPC communication.
- ➔ Added a 0.0.0.0/0 route pointing to the Internet Gateway.

➔ Verified that the public route table provided internet connectivity

The first screenshot shows the 'Attach to VPC' page for internet gateway `igw-055e9e1e91f34a4f8`. It includes a notification that the gateway was created successfully and a section for attaching it to a VPC. The 'Available VPCs' section has a search bar and a list of VPCs. The 'AWS Command Line Interface command' section is also visible.

The second screenshot shows the 'Edit routes' page for route table `rtb-05daefc11ce9f6c33`. It displays a table of routes with columns for Destination, Target, Status, Propagated, and Route Origin. The table shows two routes: one for `172.168.0.0/16` with a local target, and another for `0.0.0.0/0` with an internet gateway target.

The third screenshot shows the 'VPC dashboard' for the VPC `vpc-0072a383b0dcf876`. It displays the 'Details' tab for the route table `rtb-05daefc11ce9f6c33`, showing its main status, owner ID, and explicit subnet associations. The 'Routes' tab is also visible, showing the same two routes as the second screenshot.

## 7. Create EC2 in public subnet with t2.micro and install PHP.

- ➔ Launched a t3.micro EC2 instance in the public subnet as t2 is not available for free.
- ➔ Associated the required key pair and security group.
- ➔ Connected to the EC2 instance using SSH.
- ➔ Installed PHP on the EC2 instance.

➔ Verified the PHP installation using the PHP version command.

**Launch an instance** [Info](#)

Amazon EC2 allows you to create virtual machines, or instances, that run on the AWS Cloud. Quickly get started by following the simple steps below.

**Name and tags** [Info](#)

## 10. Configure VPC flow logs and store the logs in S3 and CloudWatch.

- ➔ Enabled VPC Flow Logs for the required VPC.
- ➔ Configured CloudWatch Logs as a flow-log destination.
- ➔ Created/configured the required IAM permissions for CloudWatch log delivery.
- ➔ Configured Amazon S3 as a storage destination for flow logs.
- ➔ Generated network traffic between the EC2 instances.
- ➔ Verified the captured network traffic logs in CloudWatch and S3

us-east-1 console.aws.amazon.com/vpcconsole/home?region=us-east-1#CreateFlowLogs:TargetResourceId=vpc-0072a383b0dec876

### Flow log settings

Name - optional

my-flow\_log1

Filter

The type of traffic to capture (accepted traffic only, rejected traffic only, or all traffic).

☐ Accept

☐ Reject

☒ All

Maximum aggregation interval [info](#)

The maximum interval of time during which a flow of packets is captured and aggregated into a flow log record.

☐ 10 minutes

☒ 1 minute

Destination

The destination to which to publish the flow log data.

☐ Send to CloudWatch Logs

☒ Send to an Amazon S3 bucket

☐ Send to Amazon Data Firehose in the same account

☐ Send to Amazon Data Firehose in a different account

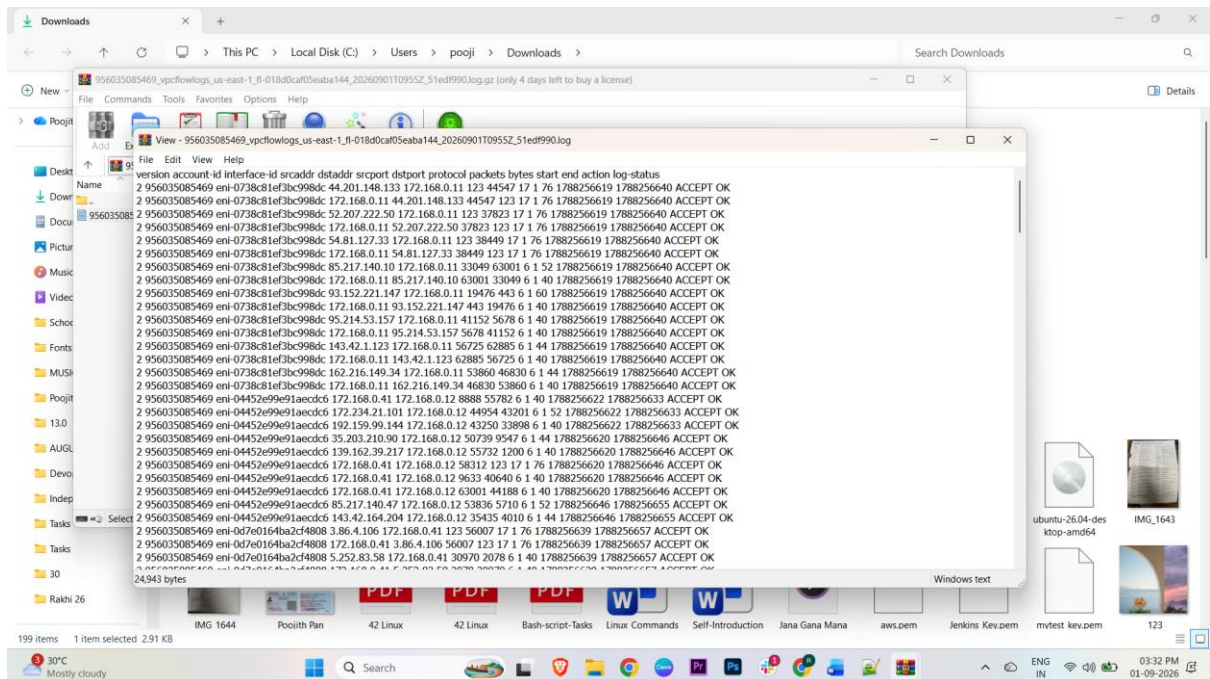

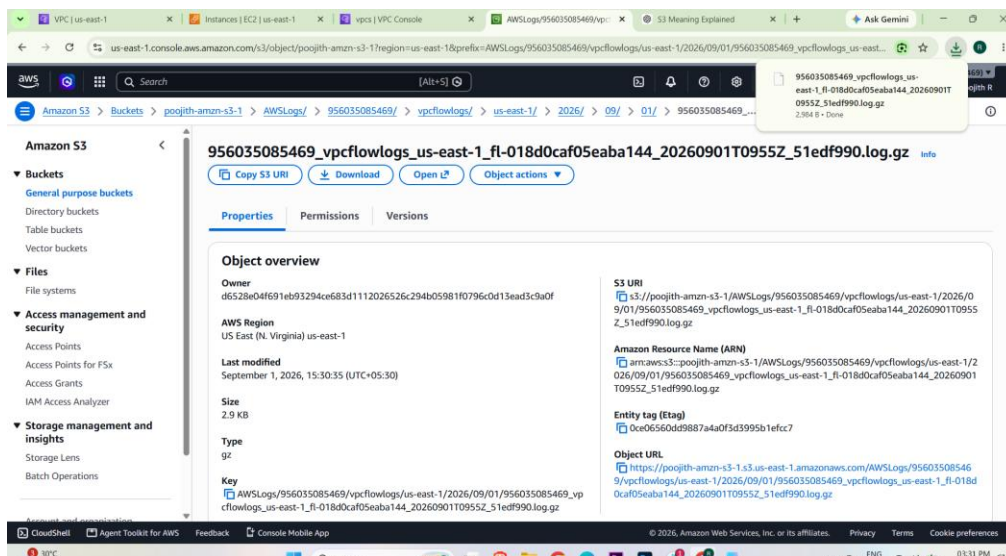

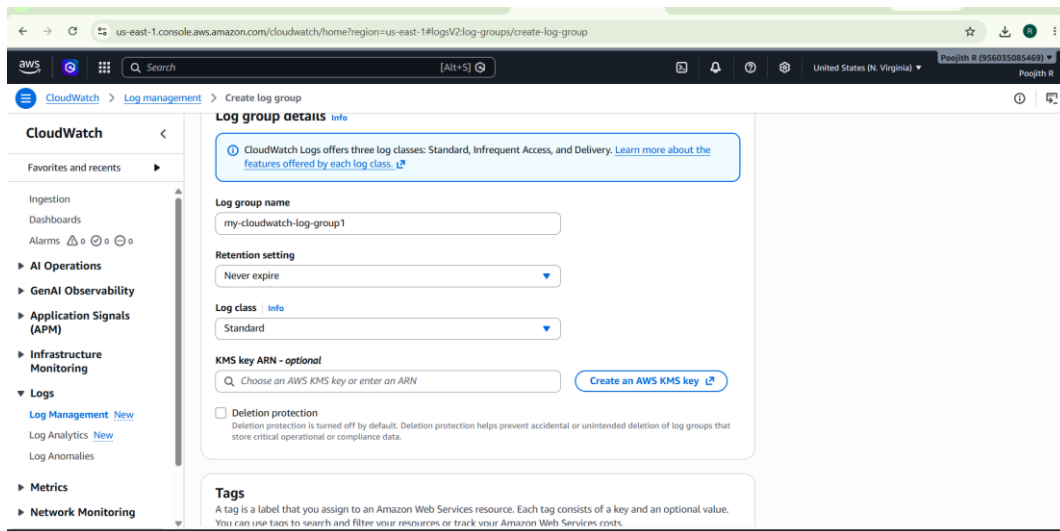

S3 bucket ARN

The ARN of the Amazon S3 bucket to which the flow log is published. You can specify a specific folder in the bucket using the `arn:aws:s3:::[bucket-name]/[folder-name]/` format.

S3 bucket ARN...

Must be in the format: `arn:aws:s3:::[bucket-name]`

[Create S3 bucket](#)
